

Project Management ITP 170.

Tuesday nights, 5:30 – 9:30.

Class begins on January 7, Tidewater Community College, Norfolk Campus.

Project Management is a skill and one of the fastest growing professional disciplines. It reaches beyond what was known and widely used by the construction industry and is being utilized on all kinds of strategic projects. Project Management breaks down the overwhelming work into controllable basics – scope, time, cost, quality, human resources, communication, project plan, assessing risk, multiple projects, scheduling, controlling and managing contracts. In this course you will learn not only the concepts of managing the project; you will also have hands-on computer training on Microsoft Project software.

Microsoft Project is a dominant software solution for planning, tracking, and managing projects and eases shared planning and scheduling with project stakeholders.
